L01 - Getting ready fro AI 900 Certification

I just finished Lab 1 on Azure AI services, focusing on the Content Safety Studio, and it was such a great experience. I learned how to create and configure an Azure AI resource, set up permissions, and test the AI's ability to moderate harmful content. Using the studio, I ran tests on sample text, and the AI flagged unsafe content with severity levels. It even handled tricky cases like misspelled violent words, which was super impressive.

One challenge was navigating the Azure portal. It's packed with features, so it took a bit to get comfortable. Setting up role assignments to give myself access was another area where I had to double-check my steps, but it gave me a better understanding of resource security.

What stood out the most was how easy it is to integrate Azure services into real-world apps. I found the keys and endpoints for the resource, which could be used in any application. It was a lightbulb moment for me, realizing how accessible these tools are for developers.

Overall, this lab gave me practical skills and showed me the power of AI for tasks like content moderation. I'm excited to explore more Azure services and think about how I can use them in future projects!
